

Test Your Internet Credibility

The majority of US college students consider these web sites to be factual:

An expose on the great tree octopus found in the American Pacific Northwest:

<https://zapatopi.net/treeoctopus/>

A discussion of famous explorers:

<https://www.allaboutexplorers.com/>

A serious study investigating whether or not the chicken or the egg came first:

<https://www.ovaprima.org/>

FYI: The above sites are all fake; they were created to emphasize that everything on the web needs to be critically examined. They all contain extremely obvious and abundant errors.

This site accurately describes the properties of a chemical, DHMO:

<https://dhmo.org/>

More than 20,000 people in California signed a petition to ban this substance. DHMO
DHMO is dihydrogen monoxide (rigorous chemical name for water)
