

## Bonding

A matter of geometry  
atoms only contact outer regions

## Octet Rule

**Eight valence electrons,  $ns^2np^6$ , is especially stable**

Noble gases do not tend to form compounds

To reach stability of the octet:

Atoms lose or gain (transfer) electrons (for ionic compounds)

Atoms share electrons (for molecular or covalent bonded compounds)

Product: both atoms with “inert configuration”

## Chemical Bonds

Attractive force that holds 2 or more atoms together in a unit

Energy of bonded pair less than energy of separated atoms

### Basic Types

#### Ionic:

Transfer of electrons from one atom  $\rightarrow$  ions

+/- ions attracted to one another

Strong electrostatic forces hold ions within crystal matrix

#### Covalent:

Sharing a pair of electrons between two nuclei

## Covalent and Ionic

## Bond Properties

	Ionic	Covalent
<b>Basic Component</b>	<b>Ions (Charged Matrix)</b>	<b>Atoms/Molecules</b>
<b>Constituents</b>	<b>Metal + Non-Metal</b>	<b>2 Non-Metals</b>
<b>State (RT)</b>	<b>Solid</b>	<b>Solid, Liquid, Gas</b>
<b>Melting Point</b>	<b>Very High (&gt; 200 °C)</b>	<b>Lower (&lt; 200 °C)</b>
<b>Odor</b>	<b>None</b>	<b>May Be Present</b>
<b>Flammability</b>	<b>No</b>	<b>Can Be</b>
<b>Conductivity</b>	<b>Solids: Poor Melted: Good Aqueous: Good</b>	<b>Solids: Poor Melted: Poor Aqueous: Poor</b>

In general covalent molecules are not electrical conductors, but some exceptions (acids) do occur

## Ionic Bonding

Ionic = separation of charge

Not a single entity between individual atoms ...

Strong electrostatic forces hold ions within crystal matrix

**Ionic Interactions: Commonly, Metal Cation & Non-Metal Anion**

Transfer of electrons from one atom to another to form ions

**Both atoms have inert (filled outer shells) configuration**

Cation smaller than neutral atom

Anion larger than neutral atom

**Ionization Energy = Amount of energy required to REMOVE electron**

Most likely to form cation

## Atom Size

Lowest ionization energy → largest distance from nucleus

## Covalent Bonding

Covalent = Sharing

Electron density shared between atoms

### Nonpolar Covalent: equal sharing of e<sup>-</sup>

Atomic Radius Influences Bond Length (Strength)

## Covalent Bonding in Methane (CH<sub>4</sub>)

Carbon & Hydrogen ~ Same Electronegativity  
Equal Electron Sharing → Non-Polar Covalent Bond

**Polar Covalent: unequal sharing of e<sup>-</sup>**

Oxygen More Electronegative than Hydrogen  
Unequal Electron Sharing → Polar Covalent Bond

## Dipole

Result of non-uniform distribution of electrons (charges):

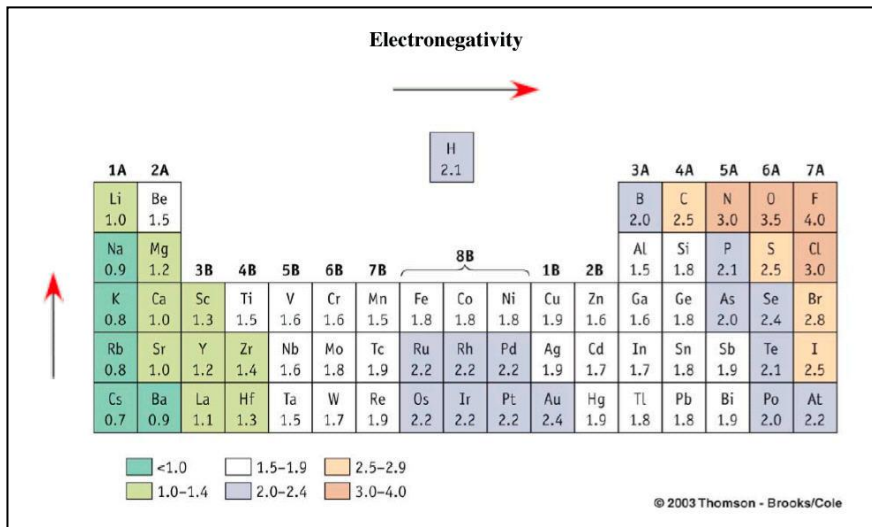

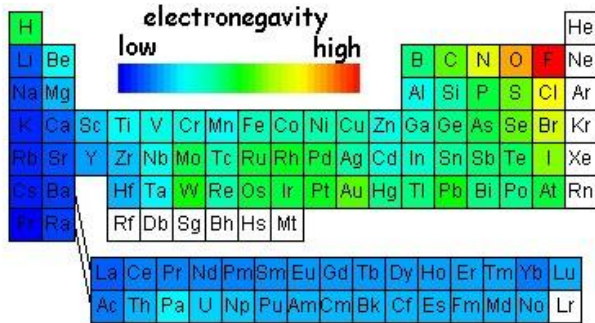

Arrow → drawn with arrowhead at most negative  
Direction reflects relative direction of charge separation  
(Result of orbital geometry)

# Electronegativity

Measure of  
ability to acquire electrons  
strength by which atoms attract bonded electron pair

High Electronegativity → easiest to add electrons to outer shell

Measure of ability to acquire electrons  
Most electronegative → negative end of dipole

### Electronegativity Differences

$\Delta \leq 0.4 \rightarrow$  non-polar covalent

$\Delta \ 0.4 - 1.9 \rightarrow$  polar covalent

$\Delta > 1.9 \rightarrow$  ionic

$\Delta$  = difference in electronegativity of the bonded atoms

#### Use Table of Electronegativities to determine bonds type

H-F

F = 4.0

H = 2.1

1.9 Polar-Covalent

Cl-F

F = 4.0

Cl = 3.0

1.0 Polar-Covalent

Na-F

F = 4.0

Na = 0.9

3.1 Ionic

Ca-F

F = 4.0

Ca = 0.7

3.3 Ionic

**Indicate which is the more polar bond**

**Indicate the polarity of the dipole**

**C-O or Si-O    H-O or H-S    H-S or H-I    H-P or H-S**

**> Electronegativity difference, > polarity**

**Most electronegative atom  $\rightarrow$  negative end of dipole**

**C-O or Si-O    H-O or H-S    H-S or H-I    H-P or H-S**

**C = 2.5**

**H = 2.1**

**H = 2.1**

**H = 2.1**

**O = 3.5**

**O = 3.5**

**S = 2.5**

**P = 2.1**

**Si = 1.8**

**S = 2.5**

**I = 2.5**

**S = 2.5**

**$\Delta$  CO = 1.0**

**$\Delta$  HO = 1.4**

**$\Delta$  HS = 0.4**

**$\Delta$  HP = 0.0**

**$\Delta$  SiO = 1.7**

**$\Delta$  HS = 0.4**

**$\Delta$  HI = 0.4**

**$\Delta$  HS = 0.4**

**SiO more polar**

**OH more polar**

**Same polarity**

**HS more polar**

**O is negative**

**O & S negative**

**S & I negative**

**S is negative**

**LPT**

## Inter-molecular Forces

### Interactions Between Molecules

Force	Model	Basis of Attraction	Energy (kJ/mol)	Example
<b>Bonding</b>				
Ionic		Cation–anion	400–4000	NaCl
Covalent		Nuclei–shared e <sup>-</sup> pair	150–1100	H–H
Metallic		Cations–delocalized electrons	75–1000	Fe

### Nonbonding (Intermolecular)

Ion-dipole		Ion charge– dipole charge	40–600	$\text{Na}^+ \cdots \text{O}-\text{H}$
H bond	$\delta^- \quad \delta^+ \quad \delta^-$ $-\text{A}-\text{H} \cdots \text{:B}-$	Polar bond to H– dipole charge (high EN of N, O, F)	10–40	$\begin{array}{c} \text{:}\ddot{\text{O}}-\text{H} \cdots \text{:}\ddot{\text{O}}-\text{H} \\   \qquad \qquad   \\ \text{H} \qquad \qquad \text{H} \end{array}$
Dipole-dipole		Dipole charges	5–25	$\text{I}-\text{Cl} \cdots \text{I}-\text{Cl}$
Ion-induced dipole		Ion charge– polarizable $e^-$ cloud	3–15	$\text{Fe}^{2+} \cdots \text{O}_2$
Dipole-induced dipole		Dipole charge– polarizable $e^-$ cloud	2–10	$\text{H}-\text{Cl} \cdots \text{Cl}-\text{Cl}$
Dispersion (London)		Polarizable $e^-$ clouds	0.05–40	$\text{F}-\text{F} \cdots \text{F}-\text{F}$

### Dipole-Dipole Interactions

Molecules with permanent Dipole  
Dipoles align ... cohesive attraction

**Alters physical properties** - Typically increases melting/boiling point  
energy needed to overcome multiple interactions

example: bp of  $\text{CH}_3\text{F} \gg \text{CH}_4$

## Hydrogen Bonds

Low Energy (weak)  
Individually weak,  
But, significant in quantity

**Pairs**  
**H & Electronegative Atom**  
**(especially N & O; F)**

Very important  
In biological systems

A strong dipole-dipole interaction

## Hydrogen Bonds-Water

Boiling Point (°C)

H <sub>2</sub> O	= 100
H <sub>2</sub> S	= - 60.7
H <sub>2</sub> Se	= - 42
H <sub>2</sub> Te	= - 2
H <sub>2</sub> Po	= 37

**Energy needed to overcome H-bonded network is considerable**

## Water & Dry Ice

Water Ice  
H-Bonded Network  
Melts 0 °C

“Dry Ice” (CO<sub>2</sub>)  
No-Bonding Network  
Sublimes (-78 °C)

## London Dispersion Forces (Van der Waals's)

### Weakest interaction

(inversely proportional to  $r^6$  between atoms)

### Temporary; when adjacent atom electrons create dipole

All atoms; more prevalent in heavier/larger

Stronger when atoms easily polarized

At 3 Angstrom, ~ 1 kcal/mole

Van der Waal Radii

Volume of space where significant

Biologically (especially in lipids) significant

### London Dispersion Forces in Fats

"Saturated" Fats are mostly linear molecules

Site of Unsaturation  
(a double bond)  
Puts a "kink" in the  
otherwise, linear chain

"Unsaturated" Fats are bent molecules

Saturated fats - linear molecules bundle together

This takes a lot of energy to undo (melt) → solids

Unsaturated fats – "kinks" prevent bundling → liquids

### Van der Waal Radii Approximates Molecular Influence

## Physical Properties & Intermolecular Forces

Control Physical properties (State of Matter)

Melting & Boiling points

Result of progressive elimination of intermolecular forces

> intermolecular forces, > energy required to melt/boil

### Boiling Point – Group 4 Hydrides

If only dispersion forces present (no H-bonding), the more mass present (higher Z), > boiling point

### Boiling Point – Some H containing Compounds

If H-bonding present, H bonded higher & Well off the curve

**Intermolecular Forces Control Physical properties (State of Matter)**

Melting & Boiling points

Result of progressive elimination of intermolecular forces

> intermolecular forces, > energy required to melt/boil

## Solubility and Intermolecular Forces

“like Dissolves Like”

**Polar solutes dissolve in water (polar solvents)**  
**Non-polar solutes dissolve in non-polar solvents**

Solvent	Chemical Formula	Boiling point	Dielectric constant	Density
<b>Non-Polar Solvents</b>				
Hexane	CH <sub>3</sub> -CH <sub>2</sub> -CH <sub>2</sub> -CH <sub>2</sub> -CH <sub>2</sub> -CH <sub>3</sub>	69 °C	2.0	0.655 g/ml
Benzene	C <sub>6</sub> H <sub>6</sub>	80 °C	2.3	0.879 g/ml
Toluene	C <sub>6</sub> H <sub>5</sub> -CH <sub>3</sub>	111 °C	2.4	0.867 g/ml
Diethyl ether	CH <sub>3</sub> CH <sub>2</sub> -O-CH <sub>2</sub> -CH <sub>3</sub>	35 °C	4.3	0.713 g/ml
Chloroform	CHCl <sub>3</sub>	61 °C	4.8	<b>1.498 g/ml</b>
Ethyl acetate	CH <sub>3</sub> -C(=O)-O-CH <sub>2</sub> -CH <sub>3</sub>	77 °C	6.0	0.894 g/ml
<b>Polar Aprotic Solvents</b>				
1,4-Dioxane	<u>/-CH<sub>2</sub>-CH<sub>2</sub>-O-CH<sub>2</sub>-CH<sub>2</sub>-O-\</u>	101 °C	2.3	<b>1.033 g/ml</b>
Tetrahydrofuran (THF)	<u>/-CH<sub>2</sub>-CH<sub>2</sub>-O-CH<sub>2</sub>-CH<sub>2</sub>-\</u>	66 °C	7.5	0.886 g/ml
Dichloromethane (DCM)	CH <sub>2</sub> Cl <sub>2</sub>	40 °C	9.1	<b>1.326 g/ml</b>
Acetone	CH <sub>3</sub> -C(=O)-CH <sub>3</sub>	56 °C	21	0.786 g/ml
Acetonitrile (MeCN)	CH <sub>3</sub> -C≡N	82 °C	37	0.786 g/ml
Dimethylformamide (DMF)	H-C(=O)N(CH <sub>3</sub> ) <sub>2</sub>	153 °C	38	0.944 g/ml
Dimethyl sulfoxide (DMSO)	CH <sub>3</sub> -S(=O)-CH <sub>3</sub>	189 °C	47	<b>1.092 g/ml</b>
<b>Polar Protic Solvents</b>				
Acetic acid	CH <sub>3</sub> -C(=O)OH	118 °C	6.2	<b>1.049 g/ml</b>
<i>n</i> -Butanol	CH <sub>3</sub> -CH <sub>2</sub> -CH <sub>2</sub> -CH <sub>2</sub> -OH	118 °C	18	0.810 g/ml
Isopropanol (IPA)	CH <sub>3</sub> -CH(OH)-CH <sub>3</sub>	82 °C	18	0.785 g/ml
<i>n</i> -Propanol	CH <sub>3</sub> -CH <sub>2</sub> -CH <sub>2</sub> -OH	97 °C	20	0.803 g/ml
Ethanol	CH <sub>3</sub> -CH <sub>2</sub> -OH	79 °C	24	0.789 g/ml
Methanol	CH <sub>3</sub> -OH	65 °C	33	0.791 g/ml
Formic acid	H-C(=O)OH	100 °C	58	<b>1.21 g/ml</b>
Water	H-O-H	100 °C	80	1.000 g/ml

## Assignment

Blackboard Unit 11 Practice Quiz

Optional Quiz on Electronegativity (Unit 11)

(Covers material that will be on the Unit 11 exam, but is not covered in Practice Quiz 11)
